X rays are a kind of super-powerful version of ordinary light: a higher- energy form of electromagnetic radiation that travel at the speed of light in straight lines (just like light waves do).

What are X rays? A simple introduction - Explain that Stuff

An X-ray is a quick and painless procedure commonly used to produce images of the inside of the body. It's a very effective way of looking at the bones and can be used to help detect a range of conditions.

Introduction ¶ Although anatomy of the abdomen is complicated, many structures are not clearly defined on a radiograph of the abdomen, and therefore cannot be fully assessed ¶ A systematic approach to abdominal X-ray interpretation is therefore relatively straightforward and involves assessment of the bowel gas pattern, soft tissue

Introduction to X-ray Astronomy

Introduction. X-rays are powerful waves of energy. Like light, X-rays are a form of radiation. They are very useful because they can go through substances that light cannot. X-rays can show images, or pictures, of the inside of an object, such as a suitcase or the human body.

MainAn introduction to X-ray metallography. An introduction to X-ray metallography. Abraham Taylor. This book should be valuable in bringing the two sciences together. While the subject has been rapidly expanding, there is a dearth of books of reference and reviews owing to the war. Dr. Taylor has collected and arranged much of the material which has appeared as scattered original papers in recent years, and it may be confidently hoped that the present volume will be very useful to the ...

Abstract. This is a short introduction of X-ray absorption spectroscopy (XAS) and its application to homogeneous transition metal compounds and catalysts. An XAS spectrum is composed of two regions, XANES and EXAFS, which provide element-specific information on formal oxidation state and local coordination environment, respectively.

An x-ray beam gets attenuated on the way out by the target material itself causing a decrease in intensity gradually from the cathode to anode direction as there is more of the target material to travel through. Therefore, the cathode side should be placed over the area of greatest density as this is the side with the most penetrating beam.
