outside cells. In the plant kingdom Ca^{2+} ions often form links between individual cells and are required for maintaining the rigidity of whole plants; some seaweeds are typical examples. In the blood plasma of mammals, in which the Ca^{2+} concentration

Calcium in Biological Systems - California Institute of ...

Calcium is unique in biological systems. Ca^{2+} is the only metal cation demonstrated to function as a secondary messenger in the cytosol of eukaryotes. The information in this pulse of Ca^{2+} ions (Berridge 2006) is

transduced into a change of conformation of a calcium-modulated protein(s). Many of these calcium-modulated proteins contain two to twelve tandem EF-hand domains.

Calcium in Biological Systems | SpringerLink
Calcium is, along with iron, silicon, and the alkaline earth metals, an important constituent of mineralized biological tissues. Some Ca²⁺-based biominerals, like bone or mother-of-pearl, can be regarded as complex composites with microscopic crystallites embedded in a protein matrix.

Calcium In Biological Systems Caltech Authors
Calcium ions (Ca²⁺) contribute to the physiology and biochemistry of organisms cell. They play an important role in signal transduction pathways, where they act as a second messenger, in neurotransmitter release from neurons, in contraction of all muscle cell types, and in fertilization. Many enzymes require calcium ions as a cofactor, including

Calcium in biology - Wikipedia

This topic explains about the biological importance of calcium and magnesium. Calcium and Magnesium are one of the most important elements that affect numerous processes inside our body. Magnesium and calcium both are extensively used as alloying agents. Calcium finds application as a reducing agent in different industries.

the Theme, this volume also includes a number of invited papers that were added to fill certain voids in topics covered.

Calcium in Biological Systems | Ronald P. Rubin | Springer

From cell-division to brain development, biological systems accomplish tasks through self-organization across molecular, cellular and organismal scales. Our goal is to understand how unexplained properties of biological systems, including their mechanical organization and their ability to process information, emerge from collective

At the center of biological dioxygen transport are transition-metal complexes of iron or copper. To model such systems, chemists have prepared several synthetic oxygen carriers, especially of iron and cobalt porphyrins. In this chapter the structures and properties of biological and nonbiological oxygen carriers

With mixed metal oxides as catalysts for water oxidation and O_2 reduction in heterogeneous and biological systems, fundamental understanding of the effects of redox inactive metals on the chemistry of mixed metal oxide clusters is important for the rational development of effective catalysts. Prior to our work, a single high oxidation state complex displaying an oxo bridged redox active ...
