Dna Repair

DNA repair is a collection of processes by which a cell identifies and corrects damage to the DNA molecules that encode its genome. In human cells, both normal metabolic activities and environmental factors such as radiation can cause DNA damage, resulting in as many as 1 million individual molecular lesions per cell per day.

DNA repair - Wikipedia

DNA repair, any of several mechanisms by which a cell maintains the integrity of its genetic code. DNA repair ensures the survival of a species by enabling parental DNA to be inherited as faithfully as possible by offspring. It also preserves the health of an individual. Mutations in the genetic code can lead to cancer and other genetic diseases.

The proper packing of the genome is critical for its healthy biological function such as gene expression, genome duplication, and DNA repair. However, both the genome ' s structure and function are highly sensitive to DNA damage, which can range from chemical change to the DNA molecule to full break of DNA ' s well-known double helix.

DNA Repair provides a forum for the comprehensive coverage of DNA repair and cellular responses to DNA damage. The journal publishes original observations on genetic, cellular, biochemical, structural and molecular aspects of DNA repair, mutagenesis, cell cycle regulation, apoptosis and other biological responses in cells exposed to genomic insult, as well as their relationship to human disease .

Introduction to DNA Damage and Repair: DNA is a highly stable and versatile molecule. Though sometimes the damage is caused to it, it is able to maintain the integrity of information contained in it.

Homologous recombination (HR) mediates the error-free repair of DNA double-strand breaks to maintain genomic stability. Here we characterize C17orf53/MCM8IP, an OB-fold containing protein that binds ssDNA, as a DNA repair factor involved in HR. MCM8IP-deficient cells exhibit HR defects, especially i ...

BRCA1 and BRCA2 are involved in homologous recombination (HR) DNA repair and are germ-line cancer pre-disposition genes that result in a syndrome of hereditary breast and ovarian cancer (HBOC). Whether germ-line or somatic alterations in these genes or other members of the HR pathway and if mono- or ...

In base excision repair, a single base is first removed from the DNA, followed by removal of a region of the DNA surrounding the missing base. The gap is then repaired. The removal of uracil from DNA is accomplished by the enzyme uracil DNA glycosylase , which breaks the bond between the uracil and the sugar in the nucleotide.

A special enzyme, DNA ligase (shown here in color), encircles the double helix to repair a broken strand of DNA. DNA ligase is responsible for repairing the millions of DNA breaks generated during the normal course of a cell ' s life. Without molecules that can mend such breaks, cells can malfunction, die, or become cancerous.

According to a report published in Nature Communications experts may have discovered a new toolkit of proteins that can repair breaks in DNA, accumulations of DNA breaks can cause aging, cancer, and motor neurone disease. Findings may also help to repair DNA breaks that are caused during chemotherapy treatment to kill cancerous cells.

Possible Toolkit To Repair DNA Breaks Associated With ...

DNA repair is the phrase used to describe a set of mechanisms utilized by living organisms to identify and rectify any damage incurred by their DNA sequence.

(a) What are the different types of DNA repair? (b) How do ...

DNA in the living cell is subject to many chemical alterations (a fact often forgotten in the excitement of being able to do DNA sequencing on dried and/or frozen specimens [Link]). If the genetic information encoded in the DNA is to remain uncorrupted, any chemical changes must be corrected. A failure to repair DNA produces a mutation.

DNA Repair - Biology Pages

Major DNA repair pathways are mismatch repair (MMR), nucleotide excision repair (NER), base excision repair (BER), homologous recombinational repair (HR), and non-homologous end joining (NHEJ). These pathways each require a number of proteins.
