in linear algebra for solving a system of linear equations. It is usually understood as a sequence of operations performed on the corresponding matrix of coefficients. This method can also be used to find the rank of a matrix, to calculate the determinant of a matrix, and to calculate the inverse of an invertible square matrix.

## Gaussian elimination—Wikipedia

Gaussian elimination proceeds by performing elementary row operations to produce zeros below the diagonal of the coefficient matrix to reduce it to echelon form. (Recall that a matrix  $A = [a_{ij}]$  is in echelon form when  $a_{ij} = 0$  for  $i > j$ , any zero rows appear at the bottom of the matrix, and the first nonzero entry in any row is to the right of the first nonzero entry in any higher row.)

There are following advantages and disadvantages of Gaussian method : Advantages of Gaussian elimination: This method is completely fair and dependable. It can solve more than 2 linear equations simultaneously. Disadvantages of Gaussian elimination: This method is very slow procedure because of this it takes time.

Gaussian elimination is a step-by-step procedure that starts with a system of linear equations, or an augmented matrix, and transforms it into another system which is easier to solve. Usually, we end up being able to easily determine the value of one of our variables, and, using that variable we can apply back-substitution to solve the rest of the system.

Resolution Method. We apply the Gauss-Jordan Elimination method: we obtain the reduced row echelon form from the augmented matrix of the equation system by performing elemental operations in rows (or columns).. Once we have the matrix, we apply the Rouch é -Capelli theorem to determine the type of system and to obtain the solution(s), that are as:

For a system of linear equations in the form  $Ax = b$ , one of the methods to solve the unknowns is Gaussian Elimination, where you form a upper triangular matrix  $U$  by forward elimination and then figure out the unknowns by backward substitution. This serves the purpose of solving a system of linear equations.

This process is known as Gaussian elimination. It's a very efficient way of solving one-off problems, and has one huge advantage over most other methods, in that it can also be used where the number of equations and the number of unknowns are not the same. It works like this. To solve the m by n system
