A linear differential equation may also be a linear partial differential equation (PDE), if the unknown function depends on several variables, and the derivatives that appear in the equation are partial derivatives. A linear differential equation or a system of linear equations such that the associated homogeneous equations have constant coefficients may be solved by quadrature, which means that the solutions may be expressed in terms of integrals. This

Linear differential equation - Wikipedia

A Partial Differential Equation commonly denoted as PDE is a differential equation containing partial derivatives of the dependent variable (one or more) with more than one independent variable. A PDE for a function  $u(x_1, \dots, x_n)$  is an equation of the form The PDE is said to be linear if  $f$  is a linear function of  $u$  and its derivatives.

In contrast, a partial differential equation (PDE) has at least one partial derivative. Here are a few examples of PDEs: DEs are further classified according to their order. This classification is similar to the classification of polynomial equations by degree.

$u(x) = \exp(\int a(x)dx)$ . Multiplying the left side of the equation by the integrating factor  $u(x)$  converts the left side into the derivative of the product  $y(x)u(x)$ .

The general solution of the differential equation is expressed as follows:  $y = \int u(x)f(x)dx + C u(x)$ , where  $C$  is an arbitrary constant.
