Percutaneous nephrostomy is a minimally invasive method for the external drainage of the upper urinary tracts, performed under ultrasonographic or fluoroscopic guidance. The purpose of the method is, first, to decrease the pressure and distension of the pyelocaliceal system, together with gaining an antegrade access to the upper urinary tract to perform different diagnostic and therapeutic procedures.

Percutaneous transhepatic cholangiography (PTHC or PTC), percutaneous hepatic cholangiogram, or percutaneous transhepatic cholangiography and drainage (PTCD) is a radiological technique used to visualize the anatomy of the biliary tract.A contrast medium is injected into a bile duct in the liver, after which X-rays are taken. It allows access to the biliary tree in cases where endoscopic ...

Percutaneous transhepatic cholangiography - Wikipedia

A percutaneous nephrostomy is the placement of a small, flexible rubber tube through your skin into your kidney to drain your urine. It is inserted through your back or flank. Percutaneous nephrostolithotomy (or nephrolithotomy) is the passing of a special medical instrument through your skin into your kidney.
