Programming or burning a microcontroller means to transfer the program from the compiler to the memory of the microcontroller. A compiler is a software which provides an environment to write, test and debug a program for the microcontroller. The program for a microcontroller is generally written in C or assembly language.

Now, we're about to discuss how an embedded program runs on a typical microcontroller in technical terms. First of all, the program should be loaded into the microcontroller's program memory (ROM). After writing the code in C, the compiler & assembler will generate a .hex file that you should burn (flash) to the microcontroller chip thereafter.
