By the close of the following century, Richard Cantillon had presented the market system as self-equilibrating, a machine that functions in a law-like manner; Quesnay's Tableau had depicted the economic system as a unified process of reproduction; Adam Smith had theorised the dynamics of economic growth; and philosophers (such as William Paley) had developed the creed that steady economic growth legitimates the social system and renders system-critical demands unnecessary and dangerous.

Discussing the process of economic development in Japan, this book covers the period from when Japan first entered upon her career of Westernization to the beginning of the war with China in 1937. The main emphasis is on industrial and financial development and organization and on economic policy. Among the industries discussed are agriculture, textiles, steel and shipping. A comprehensive glossary and bibliography are included and much of the statistical information is tabulated for ease of reading.

The Routledge Handbook of Modern Economic History aims to introduce readers to important approaches and findings of economic historians who study the modern world. Its short chapters reflect the most up-to-date research and are written by well-known economic historians who are authorities on their subjects. Modern economic history blends two approaches - Cliometrics (which focuses on measuring economic variables and explicitly testing theories about the historical performance and development of the economy) and the New Institutional Economics (which focuses on how social, cultural, legal and organizational norms and rules shape economic outcomes and their evolution). Part 1 of the Handbook introduces these approaches and other important methodological issues for economic history. The most fundamental shift in the economic history of the world began about two and a half centuries ago when eons of slow economic change and faltering economic growth gave way to sustained, rapid economic expansion. Part 2 examines this theme and the primary forces economic historians have linked to economic growth, stagnation and fluctuations - including technological change, entrepreneurship, competition, the biological environment, war, financial panics and business cycles. Part 3 examines the evolution of broad sectors that typify a modern economy including agriculture, banking, transportation, health care, housing, and entertainment. It begins by examining an equally important "sector" of the economy which scholars have increasingly analyzed using economic tools - religion. Part 4 focuses on the work force and human outcomes including inequality, labor markets, unions, education, immigration, slavery, urbanization, and the evolving economic roles of women and African-Americans. The text will be of great value to those taking economic history courses as well as a reference book useful to professional practitioners, policy makers and the public.

The gap between the rich and the poor can be vast. Robert C. Allen considers the main factors that contribute to this gap, looking at the interconnections between economic growth, culture, technology, and income distribution. Exploring the historical processes that have created the unequal world of today, he takes a global look at wealth worldwide.

Why are some countries rich and others poor? In 1500, the income differences were small, but they have grown dramatically since Columbus reached America. Since then, the interplay between geography, globalization, technological change, and economic policy has determined the wealth and poverty of nations. The industrial revolution was Britain's path breaking response to the challenge of globalization. Western Europe and North America joined Britain to form a club of rich nations by pursuing four policies-creating a national market by abolishing internal tariffs and investing in transportation, erecting an external tariff to protect their fledgling industries from British competition, banks to stabilize the currency and mobilize domestic savings for investment, and mass education to prepare people for industrial work. Together these countries pioneered new technologies that have made them ever richer. Before the Industrial Revolution, most of the world's manufacturing was done in Asia, but industries from Casablanca to Canton were destroyed by western competition in the nineteenth century, and Asia was transformed into 'underdeveloped countries' specializing in agriculture. The spread of economic development has been slow since modern technology was invented to fit the needs of rich countries and is ill adapted to the economic and geographical conditions of poor countries. A few countries - Japan, Soviet Russia, South Korea, Taiwan, and perhaps China - have, nonetheless, caught up with the West through creative responses to the technological challenge and with Big Push industrialization that has achieved rapid growth through investment coordination. Whether other countries can emulate the success of East Asia is a challenge for the future.
