Polymer solar cells can be produced by a continuous low cost coating and drying process. This work details a specialized experimental set-up to enable large scale roll to roll processing. Material properties such as surface energy, surface tension, and viscosity are presented and modelled. The impact of coating method, as well as process parameters (e.g. coating speed, shear rate, solvent composition) on process stability and film properties, is discussed. "This magnificent love letter to Rome" (Stephen Greenblatt) tells the story of the Eternal City through pivotal moments that defined its history—from the early Roman Republic through the Renaissance and the Reformation to the German occupation in World War Two—"an erudite history that reads like a page-turner" (Maria Semple). Rome, the Eternal City. It is a hugely popular tourist destination with a rich history, famed for such sites as the Colosseum, the Forum, the Pantheon, St. Peter's, and the Vatican. In no other city is history as present as it is in Rome. Today visitors can stand on bridges that Julius Caesar and Cicero crossed; walk around temples in the footsteps of emperors; visit churches from the earliest days of Christianity. This is all the more remarkable considering what the city has endured over the centuries. It has been ravaged by fires, floods, earthquakes, and—most of all—by roving armies. These have invaded repeatedly, from ancient times to as recently as 1943. Many times Romans have shrugged off catastrophe and remade their city anew. "Matthew Kneale [is] one step ahead of most other Roman chroniclers" (The New York Times Book Review). He paints portraits of the city before seven pivotal assaults, describing what it looked like, felt like, smelled like and how Romans, both rich and poor, lived their everyday lives. He shows how the attacks transformed Rome—sometimes for the better. With drama and humor he brings to life the city of Augustus, of Michelangelo and Bernini, of Garibaldi and Mussolini, and of popes both saintly and very worldly. Rome is "exciting...gripping...a slow roller-coaster ride through the fortunes of a place deeply entangled in its past" (The Wall Street Journal).

"This book gives thorough, scholarly coverage of an area of growing importance in computer security and is a 'must have' for every researcher, student, and practicing professional in software protection." —Mikhail Atallah, Distinguished Professor of Computer Science at Purdue University Theory, Techniques, and Tools for Fighting Software Piracy, Tampering, and Malicious Reverse Engineering The last decade has seen significant progress in the development of techniques for resisting software piracy and tampering. These techniques are indispensable for software developers seeking to protect vital intellectual property. Surreptitious Software is the first authoritative, comprehensive resource for researchers, developers, and students who want to understand these approaches, the level of security they afford, and the performance penalty they incur. Christian Collberg and Jasvir Nagra bring together techniques drawn from related areas of computer science, including cryptography, steganography, watermarking, software metrics, reverse engineering, and compiler optimization. Using extensive sample code, they show readers how to implement protection schemes ranging from code obfuscation and software fingerprinting to tamperproofing and birthmarking, and discuss the theoretical and practical limitations of these techniques. Coverage includes Mastering techniques that both attackers and defenders use to analyze programs Using code obfuscation to make software harder to analyze and understand Fingerprinting software to identify its author and to trace software pirates Tamperproofing software using guards that detect and respond to illegal modifications of code and data Strengthening content protection through dynamic watermarking and dynamic obfuscation Detecting code theft via software similarity analysis and birthmarking algorithms Using hardware techniques to defend software and media against piracy and tampering Detecting software tampering in distributed system Understanding the theoretical limits of code obfuscation
